ABSTRACT

Various species of fish in the Włocławskie Lake and in the Vistula River below as well as above the reservoir showed poor quality or were classified uneatable due to off-flavours except in summer of the season 1969-1970. Sensory analysis of bream (*Abramis brama* (L.)) and of pike-perch (*Stizostedion lucioperca* (L.)) collected in summer 1983 and in spring, 1984 were of similarly poor quality. Thus, it had been no changes in the pollution of the Vistula River responsible for the off-flavours in fish over the 14 years.
